Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C; Complex: disulfide-bonded heterodimer of chains derived from the same precursor C; Function:
A.Description: stimulates mitosis of hepatocytes and other cells
A.Note: does not have proteinase activity
C; Superfamily: hepatocyte growth factor; kringle homology; trypsin homology

A; Note: the authors' translation for residue 458 (Thr) is inconsistent with the nucleotic Ccomplex: disulfide-bonded heterodimer of chains derived from the same precursor C; Function:
A; Description: stimulates mitosis of hepatocytes and other cells
A; Note: does not have proteinase activity
C; Superfamily: hepatocyte growth factor; kringle homology; trypsin homology

-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1. PLASMINOGEN SUBFAMILY.
-!- SIMILARITY: CONTAINS 4 KRINGLE DOMAINS.
"Molecular cloning and characterization of cDNA encoding mouse hepatocyte growth factor.";
Biochim. Biophys. Acta 1216:299-303(1993)
-!- FUNCTION: HGF IS A POTENT MITOGEN FOR MATURE PARENCHYMAL HEPATOCYTE CELLS, SEEMS TO BE AN HEPATOTROPHIC FACTOR, AND ACTS AS GROWTH FACTOR FOR A BROAD SPECTRUM OF TISSUES AND CELL TYPES.
IT HAS NO DETECTABLE PROTEASE ACTIVITY.
-!- SUBBUNIT: DIMER OF AN ALPHA CHAIN AND A BETA CHAIN LINKED BY A DISULFIDE BOND.
                                                                                                                                                                                                                                                 -!- ALTERNATIVE PRODUCTS: 2 isoforms; a long form (shown here) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KRINGLE 1.

CANNOT BE ACTIVATED WITH STREPTOKINASE.

FIREY. N-LINKED GLYCAN CONTAINS N-ACETYLLACTOSAMINE, SIALIC ACID AND IS CORE FUCOSYLATED. O-LINKED GLYCANS CONSIST OF GAL-GALNAC DISACCHARIDE WITH IS MODIFIED WITH UP TO 2 SIALIC ACID RESIDUES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        J. Blochem. 13:57-63(1988).

FUNCTION: PLASMIN DISSOLVES THE FIBRIN OF BLOOD CLOTS AND ACTS AS A PROTEOLYTIC FACTOR IN A VARIETY OF OTHER PROCESSES INCLUDING EMBRYONIC DEVELOPMENT. TISSUE REMODELING, TUMOR INVASION, AND INFLAMMATION; IN OVULATION IT WEAKENS THE WALLS OF THE GRAFIAN FOLLICLE. IT ACTIVATES THE URCHINASE-TYPE PLASMINOGEN ACTIVATOR, COLLAGENAES AND SEVERAL COMPLEMENT ZYMOGENS, SUCH LAMININ AND VON WILLEBRAND FACTOR.

CATALYTIC ACTIVITY: PREFERENCE IN THROMBOSPONDIN, CATALYTIC ACTIVITY: PREFERENCE IN THROMBOSPONDIN, CATALYTIC ACTIVITY: PREFERENCE IN CONVERTS fibrin into soluble
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 IMMEDIATELY AFTER DISSOCIATION FROM THE CLOT.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1. PLASMINOGEN SUBFAMILY.
-!- SIMILARITY: CONTAINS 5 KRINGLE DOMAINS.
